

PCAccess — FileAccessAgent & Dual-Agent Guide

Host Workstation Sharing Service & Architectural Comparison

- English Edition
- Host Workstation
- SignalR WebSocket
- Windows Service

1. Overview: What is FileAccessAgent?

FileAccessAgent is a secure background service that runs on the **Host PC / Office Server** where company files physically reside.

Key Architecture: Similar to TeamViewer or AnyDesk, it establishes an **outbound-only WebSocket connection** via SignalR to `https://pccaccess.ourdemos.com`. It requires **no public IP, no static IP, and no router port-forwarding**.

2. Pairing Workflow (Step-by-Step)

- 1 **Run Agent:** Double-click `run.bat` on the Host PC.
- 2 **View 6-Digit PIN:** A temporary 6-digit pairing code (e.g., 582-194) appears on the console, valid for 15 minutes.
- 3 **Pair via Web Portal:** Log in to the Admin Dashboard (`https://pccaccess.ourdemos.com/Admin/DeviceFolders`) and submit the 6-digit code.
- 4 **Device Becomes ONLINE:** A cryptographic token binds the device permanently. The web dashboard will now show the device as **ONLINE**.
- 5 **Assign Folders:** Register local physical paths (e.g. `D:\CompanyFiles`) and grant permissions to users.

3. Windows Service Controls (24x7 Unattended Operation)

Script	Command	Purpose
<code>install-service.bat</code>	<code>FileAccessAgent.exe --install</code>	Registers the agent as a Windows Service that automatically starts on PC boot.
<code>start-service.bat</code>	<code>FileAccessAgent.exe --start</code>	Starts the installed Windows Service.
<code>stop-service.bat</code>	<code>FileAccessAgent.exe --stop</code>	Halts the running service safely.
<code>check-status.bat</code>	<code>FileAccessAgent.exe --status</code>	Checks if the service is running and displays recent log entries.

Script	Command	Purpose
uninstall-service.bat	FileAccessAgent.exe -- uninstall	Unregisters and removes the service from Windows.

4. Deep Comparison: UserLoginAgent vs FileAccessAgent

Feature	FileAccessAgent (Host Service)	UserLoginAgent (Client Drive)
Primary Purpose	Folder Provider (Host) Shares physical directories to the cloud network.	Folder Consumer (Client) Mounts authorized folders as local virtual drive R:.
Installed Where?	Host machine / Office PC storing actual files.	Employee / User laptops and PCs.
Authentication	Temporary 6-Digit Pairing PIN + Admin Approval.	Username / Email + Password.
Drive Mount (R:)	No virtual drive mounted on host.	Yes! Automatically mounts R: \.
Network Protocol	Outbound SignalR WebSocket (WSS).	REST API Authentication + Win32 Kernel Mount.

5. Frequently Asked Questions

Q1: Does UserLoginAgent require FileAccessAgent to be running?

No! UserLoginAgent will always mount Drive R: and display folder names even if the host PC is offline. However, browsing live real-time files inside those folders requires the host PC's FileAccessAgent to be online.

Q2: Can both agents run on the same computer?

Yes! If your computer is both the folder provider and you also want to mount R: drive as a user, both agents run side-by-side without conflict.
